

Evendor DigitAll is a solution specially tailored to meet document digitization requirements for Payment Incident Management Systems, expressly designed for Processors, Banks and Large Surface retail stores.

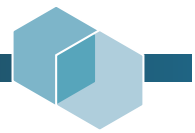

Evendor Digitall digitization centre

The implantation of electronic documentation exchange systems on the Processing Nodes for various different Payment Transaction systems (VISA-View®, MasterCard- MasterCom®, Sermepa-Estación Gutemberg, Sistema 4B-SIED, CECA-SIED) has led companies concerned to increase their levels of document digitization. New automated transmission methods which reduce the need for paper transferrals have allowed processing time and operational costs to be reduced. The Evendor DigitAll Digitization Centre provides the basic.

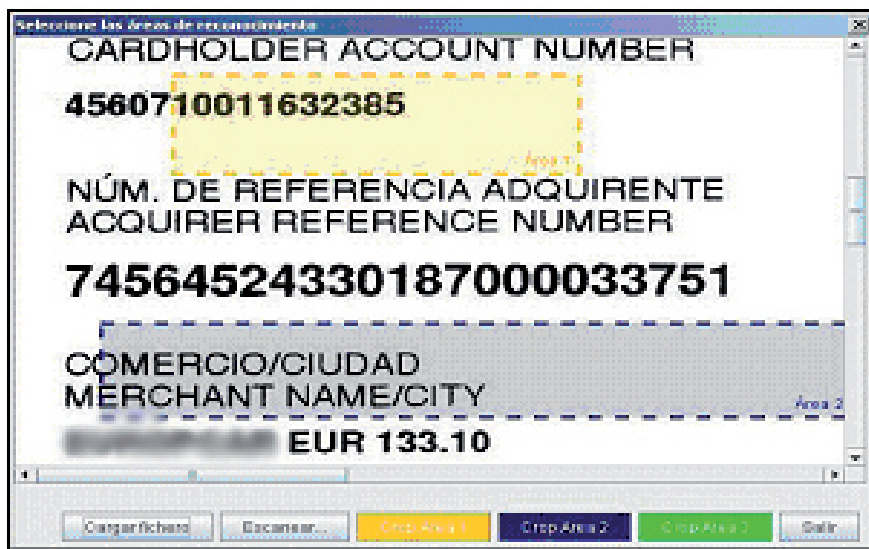

The Evendor DigitAll Digitization Centre provides the basic requirements to capture and process information from paper documents to electronic media, ready for storage and/or transmission.

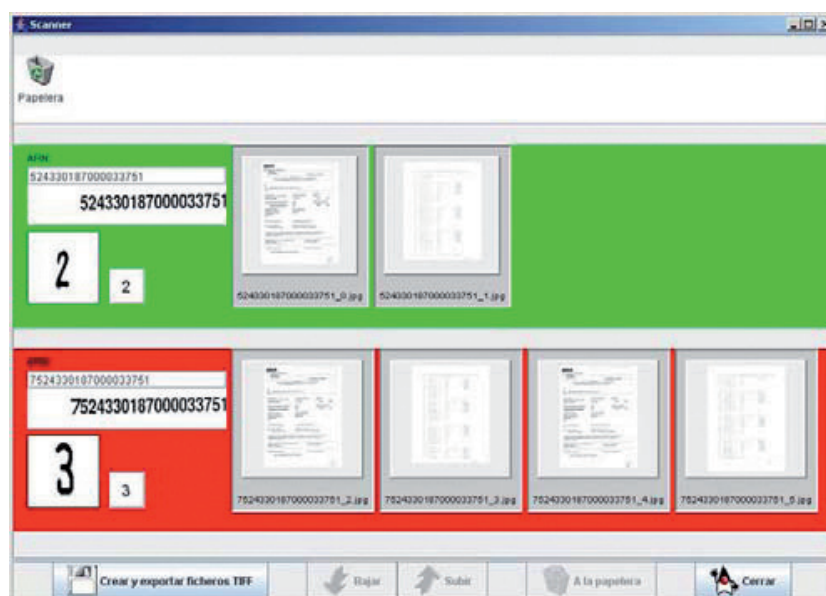

OCR capabilities

The solution allows fine tuning of up to three character recognition zones. The output TIFF files can be automatically specified, or file processing control parameters can be set.

Specific tools to handle incident management documentation are embedded in the software. After running data capture and OCR procedures, documents are grouped appropriately and any discrepancies arising during the process eliminated.

As soon as multi-page TIFF files (ARNs) have been generated for each item processed, they are ready and suitably identified for storage or electronic transfer (Evendor SIED). Time saved and enhanced dependability grow exponentially with the implementation of this solution. The new support media open up a whole range of possibilities for document management, allowing significantly increased efficacy that, in turn, translates instantaneously into cost savings.

This Digitization Centre can be integrated as a module in the Electronic Document Exchange System (Evendor SIED), whose function is to send and receive documentation via the Gutenberg transfer protocol between electronic transaction processor nodes (Sermepa, CECA and Sistema 4B).
